

Plajah — The Ancillary Education Platform

A ClassDojo-class competitor strategy (elementary → high school) Strategy & build plan · June 2026

Thesis: ClassDojo, Seesaw, Remind, Bloomz and the LMS incumbents each own one slice of the school day and force teachers, students, and parents to juggle five disconnected apps. Plajah already has the connected substrate none of them have — identity, social graph, gamification, portfolios, live video, a safe-content engine, an athlete/creator identity that grows with the child, a digital reading library (Lorea), and a portable, student-owned record. Plajah doesn't beat ClassDojo by cloning it. It absorbs the entire category as one coherent, age-scaling, family-safe layer — the most comprehensive ancillary educational tool, sitting beside whatever LMS a district already mandates.

1. The Landscape — Who Owns What, and Where They're Weak

Competitor	Grade band	What it owns	Core weakness / frustration
ClassDojo	K–6	Behavior points, class story, parent messaging	Babyish for older kids; points feel arbitrary/ bribery; no grades, no real portfolio, data not portable
Seesaw	K–5	Student work portfolio, parent visibility	Portfolio dies at year-end; weak behavior/ communication; paywalled features
Remind	K–12	Mass teacher→parent texting	One-way blast only; no portfolio, no behavior, no content; pivoting to paid
Bloomz / ParentSquare	K–12	Parent comms, sign-ups, conferences	Admin-comms tool, not a student experience; nothing for the kid
Brightwheel	Pre-K	Daycare check-in, billing, photos	Bottom of the age range only; no academic continuity
Google Classroom / Canvas	4–12+	Assignments, grades, the LMS of record	Cold, utilitarian; parents barely see it; zero engagement/behavior/portfolio; not the <i>family</i> surface
Khan / Prodigy / IXL	K–12	Practice content	Content silo; no classroom social, no parent loop, no portfolio of the <i>whole</i> child

The structural gap: every incumbent is a *single-function* tool. The teacher runs grades in Canvas, behavior in ClassDojo, portfolio in Seesaw, messaging in Remind, and practice in IXL — five logins, five data silos, five parent notification streams. Nobody owns the **whole child across years**, and nobody is the **family-safe place the student actually wants to be**.

2. The Top 5 Pain Points — and How Plajah Solves Each

Pain 1 — "I'm drowning in disconnected apps." (*Teachers*)

Five tools, five gradebooks, five parent-message inboxes; nothing talks to anything. **Plajah wins:** one platform where classroom + lessons + live sessions + behavior + portfolio + parent messaging already coexist on a shared identity and social graph. A teacher posts once; it lands in the gradebook, the student's portfolio, and the parent's digest simultaneously. *Plajah's existing ClassroomsView, Postman messaging, gamification services, and live-video stack are the pieces — they just need to be wired into one classroom surface.*

Pain 2 — "Points are a black box that bribes my kid." (*Parents + students*)

ClassDojo points are subjective, teacher-invented, and evaporate at year-end. **Plajah wins:** points map to **real, verifiable artifacts** — a graded submission, a completed lesson, a verified milestone — using the same **verify-then-record trust model** Plajah built for athletes (an achievement is earned against evidence, then permanently recorded). Behavior points become a transparent ledger tied to actual work, not a slot machine. The record is **student-owned and portable** (ties to Creator Passport / the chain record), so it follows the child K→12 and beyond instead of dying in a vendor's database.

Pain 3 — "I only hear from school when something's wrong." (*Parents*)

Remind/ClassDojo are one-way teacher→parent blasts. **Plajah wins:** a real **Parent account** linked to the child's living **portfolio** — weekly auto-digests ("here's what Maya made and mastered this week"), two-way classroom-scoped threads, and celebration of positives by default. Postman already provides the messaging primitive; it just needs a classroom-scoped, parent-aware layer.

Pain 4 — "This feels babyish — my middle/high schooler won't touch it." (*Older students*)

ClassDojo's monsters/avatars cap out at ~grade 5. **Plajah wins:** the **same account scales up**. The elementary kid's portfolio becomes the middle-schooler's creator profile becomes the high-schooler's **athlete/recruiting profile or creator résumé**. One identity, age-appropriate skin at every stage — Plajah already has the creator tools, Labs (12 science disciplines), athlete profiles, and music/film studios older students actually want.

Pain 5 — "It's not really my child's record — it's locked in a vendor." (*Everyone*)

Seesaw portfolios and Dojo points are non-portable and vendor-owned. **Plajah wins:** a **student-owned, portable record** — the portfolio, achievements, and reading progress belong to the family and travel across schools, grades, and platforms (Creator Passport foundation; optional chain anchoring like the athlete achievements). Switch schools, change teachers — the record persists.

3. Competing With Their Strengths (Not Just Their Weaknesses)

- **ClassDojo's strength is the *daily ritual*** (the class-story check-in parents love). Plajah matches it with a **living portfolio feed** that's richer (real work + behavior + reading + creative output) and safe-by-default for kids.
- **Seesaw's strength is *student work capture***. Plajah already has media capture, galleries, and creator tools — capture is a solved primitive; Plajah adds the *cross-year continuity* Seesaw lacks.
- **Remind's strength is *reach (SMS)***. Plajah matches with push + email digests, but adds the two-way, context-rich thread Remind never had.
- **Google Classroom's strength is *being the system of record***. Plajah does **not** fight to replace the LMS — it's the **ancillary family-and-engagement layer beside it**, importing rosters and grades rather than owning them. This is the wedge: districts don't rip out Canvas, but they'll add the free, safe, engaging family layer.

4. Plajah's Unfair Advantages (Things No EdTech Competitor Has)

1. **A family-safe content engine** — kids accounts with adult-content filtering, maturity gating, kids-mode skinning, and parental screen-time controls built into the *same* platform (see §5). No EdTech competitor has a real media platform to make safe; Plajah does.
2. **Lorea — a built-in digital reading library** — populated with public-domain / Creative-Commons /

ClassDojo has nothing like a library; Plajah turns "20 minutes of reading" homework into a tracked, in-platform experience.

3. **Gamification that's already built** (achievements / points / badges services) — just not yet wired to classrooms. Wiring it is the ClassDojo-killer feature.
4. **Identity that scales K→12→career** — the same account becomes a creator, athlete, scientist (Labs), or musician profile. Engagement that *grows up* with the student.
5. **Verify-then-record trust** — the athlete-achievement model applied to learning milestones makes points trustworthy and portable.
6. **Live video + portfolio + social, already production-grade** — class live sessions, work capture, and a moderated social layer exist today.

5. Child Safety & Family Controls — The Foundation (build first)

Because the user base includes minors, the safety layer is the prerequisite for everything else.

- **Account types: PARENT and CHILD.** A parent account links to one or more child accounts (*guardianUid*). A child account is created/managed by the guardian.
- **Safe-by-default for children:** the **adult-content filter is ON by default** and cannot be disabled by the child. Age-gated / restricted / explicit content in Movies, Music, and the social Feed is hidden for child accounts.
- **Maturity gating:** a single *maxMaturity* ceiling (G / PG / PG-13 / TEEN / MATURE) the parent sets; the central content-safety engine filters every surface against it, reading existing content flags (*isExplicit, isNSFW, ageRestriction*) plus a maturity rating.
- **Auto-hide adult-themed posts:** the Feed runs through the safety filter for child viewers.
- **Kids-Mode skinning (foundation):** a kids-mode flag + safe theme/affordances that can re-skin the

entire Plajah experience for a child — bigger, friendlier, fewer adult surfaces, curated entry points (Lorea, Classroom, age-appropriate creation).

- **Timed sessions / screen time:** parent-set daily time limit and allowed hours; when exceeded, the child's session locks behind a parent passcode.

This foundation is what makes Plajah a place parents trust their kids — the thing no EdTech competitor can offer, because none of them run a media platform.

6. The Build Plan (phased)

Phase 0 — Family & Safety foundation (*prerequisite*)

- PARENT / CHILD account types; guardian linkage; `parentalControls` model.
- Central `contentSafety` engine + Feed/Movies/Music adoption.
- Kids-Mode foundation (theme + safe affordances) and parental screen-time guard.
- Parental Controls panel for guardians.

Phase 1 — ClassDojo core (the daily loop)

against real events (submission, lesson complete, teacher recognition).

- **Attendance** (daily check-in / tardy), real **lesson-completion + progress** (replace the faked `Math.random()` analytics).
- **Class story / portfolio** — the living feed of a child's work + wins.

Phase 2 — The parent loop

- Parent portal: each child's portfolio, points ledger, attendance, progress.
- Classroom-scoped two-way **parent↔teacher messaging** + weekly auto-digests + announcements.

Phase 3 — Reading & content

- **Lorea children's library:** ingest public-domain / CC / open-licensed children's books + **learn-to-read tools** (phonics, sight words, leveled readers); reading-time tracking tied to classroom + parent visibility.

Phase 4 — Continuity & portability

- Student-owned, portable record (Creator Passport / optional chain anchoring); identity scales into creator/athlete/Labs profiles as the student ages up.

7. Go-to-Market Wedge

1. **Free, safe, and additive** — districts keep their LMS; Plajah is the no-rip-and-replace family-engagement + reading layer beside it.
2. **Win the parent, not the procurement office** — the safe-content + reading library + portfolio is a *consumer* value prop parents adopt directly; teachers follow where parents already are.

3. **Age-up retention** — the one EdTech tool a family never outgrows, because the same identity becomes the kid's creator/athlete/scholar profile. This is the structural moat ClassDojo (capped at grade 5) can never cross.
-

Companion to the platform's existing classroom system ([ClassroomsView](#)), gamification services (achievement/points/badge), Postman messaging, Lorea reader, and the Athlete verify-then-record model. Phase 0 (Family & Safety foundation) is built first; subsequent phases build on it.
